

DIVERSEMASTER GRASS BLEND

Key Features

Diversemaster is a formulation of grasses and legumes designed for producers who want high biodiversity in their pastures. This multi-species mix contains the latest releases of improved grasses and legumes, offering different maturities to extend the window for harvest or grazing while maintaining quality. This formulation contains wide variation in root structure and diverse nutritional benefit.

Seeding Rate

20-30 lbs/acre for straight seeding
10-15 lbs/acre for interseeding into existing stand

Seeding Depth

¼" into a firm, clod-free seedbed
½" for no-tilling into established stand

History and Development

Diversemaster is designed for a wide range of applications. The greater variation in a farm's soil types and fertility levels, the more important it is to encourage biodiversity. The species in this mix create better stand establishment and more persistent stand life with better forage quality over an extended period of time. Diversemaster is well-suited for prescribed grazing practices and will benefit from longer recovery periods between grazing events.

Management Keys

Diversemaster will need a longer rest and recovery period to aid in persistence of plant types that require recovery. The quality of forage supports grass-finishing of beef and grass-based dairy production on more variable soil types. Diversemaster has a wide range of seed sizes and will be best suited to broadcast seeding, then rolling with a packer for best soil-to-seed contact. If drilling in the seed, it's important use a drill that can handle this variety in seed size. Calibrating the drill or seeder will save both time and money.

Components

Tall Fescue
Meadow Fescue
Perennial Ryegrass
Italian Ryegrass
Alfalfa
Red Clover
Meadow Brome
Alaskan Brome
Lespedeza
Birdsfoot Trefoil
Orchardgrass
Alsike Clover
White Clover
Timothy
Festulolium
