

# Horsemaster GRASS BLEND

## Key Features

---

Horsemaster is a premium grass seed pasture mixture. This mixture was developed to withstand the grazing and traffic pressure of horses while providing the forage a horse requires. Developed with varieties that have a low growing point to tolerate the close, continuous grazing patterns of horses as well as a high feed value and adequate fiber to meet the nutrient requirements of a horse.

## Seeding Rate

---

20-25 lbs/acre for straight seeding  
10-15 lbs/acre overseeding into existing pasture

## Seeding Depth

---

¼" into a firm, clod-free seedbed  
½" for no-tilling into existing pasture

## Management Keys

---

In moderate climates or in hot, dry areas with irrigation, plantings may be made in both spring and fall. In areas prone to summer drought, early fall sowing is recommended.

To maximize tiller growth during the first year, pasture height should be maintained in the 3 to 10 inch range. Once the newly seeded plants are firmly rooted, they should be lightly grazed or machine mowed several times before heavy use. Proper grazing management and rest periods will promote optimal forage production and maintain a dense, vegetative stand. Pasture should be allowed to reach 6 inches and then grazed or mowed to a 3 inch residual.

Components	%
Soft Leaved Tall Fescue	40
Timothy	25
Orchardgrass	20
Perennial ryegrass	10
Kentucky bluegrass	5
