

# RegalGraze White Clover

## Key Features

---

RegalGraze is a high yielding Ladino clover that is most commonly used for cattle pasture. RegalGraze can be planted or seeded as a component of a pasture mixture with perennial grasses, or overseeded into established grass stands. RegalGraze is superior in forage yield with more grazing tolerance than other Ladino clovers in tests conducted by the University of Georgia. RegalGraze has no anti-quality cyanogenic glucosides, unlike some other white clovers

- Large Leafed
- Heat Tolerant
- Palatable
- Winter Hardy
- Preferred by livestock & wildlife

## Applications

---

Pasture

## Planting Time

---

Spring & Fall

## Establishment

---

Can be drilled into or broadcast onto a prepared seed bed. It also can be directly seeded into an existing grass sward. In the fall, RegalGraze should be planted at least 8 weeks before a killing frost. Frost-seeding in the early spring can be effective in northern regions of the U.S.

## Management Keys

---

Proper management is required to maintain the balance of grass and clover in a pasture. Two tools to control this balance are fertility and pasture height. Initially, a lower pasture height should be maintained to allow sunlight to reach the clover. If the clover begins to dominate the pasture, allowing the pasture height to increase will reduce clover growth. In contrast, if the proportion of clover is low, an increased frequency of harvest will promote clover growth. Proper fertility and grazing management will help reduce the risk of bloat.

## Characteristics

---

N Fixation	5
Forage Quality	5
Recovery	5
Traffic Tolerance	4

Scale 1-5 (1 = Poor, 5 = Excellent)

## Seeding Rate

---

New Seeding 3-5 lbs/acre  
Overseeding 2-4 lbs/acre

## Seeding Depth

---

Plant no deeper than 1/2"
