

Tonic Forage Plantain

Key Features

TONIC plantain is a mineral-rich perennial grazing herb that is a valuable pasture component, particularly in drier regions and less fertile conditions. TONIC has a similar yield potential and suits similar management systems to perennial ryegrass.

Tonic can add value, both in terms of dry matter and quality, in a diverse range of ways in any farming system. The benefits of Tonic include improved dry matter production and quality at key times of the year. Tonic also has a positive impact on animal performance by improving the supply of some trace elements. Tonic suffers from few pests and diseases.

- Valuable season long production
- Source of key minerals - calcium, sodium, copper, selenium
- Degree of drought tolerance due to deep coarse root system
- Strong cool-season growth
- Suits wide range of environments and soil conditions

Applications

Rotational Grazing

Planting Time

Fall, Spring

Establishment

Pre-emergent weed control is important as Tonic is susceptible to broadleaf herbicides after emergence.

Management Keys

Tonic is highly palatable and preferentially grazed. Tonic suits a grazing management similar to ryegrass, with potential yields like that of perennial ryegrass. Ideally a 20-25-day rotation will maintain seed head palatability through late spring and summer. Plantain is a fast-establishing species, and will be productive and persistent over a wide range of soils and climate conditions. It appears to tolerate acidic soil.

Characteristics

| | |
|-------------------|---|
| Forage Quality | 5 |
| Recovery | 4 |
| Traffic Tolerance | 4 |

Scale 1-5 (1 = Poor, 5 = Excellent)

Seeding Rate

Not recommended unless in a blend

Seeding Depth

1/4" to 3/4" into a firm seedbed
